

MISSISSIPPI SOYBEAN PROMOTION BOARD

SOYBEAN VARIETIES' DISEASE RATINGS—2015

Dr. Tom Allen, Extension Plant Pathologist at DREC-Stoneville, has posted ratings for various diseases that affect soybean varieties that were grown in the 2015 Mississippi Soybean Variety Trials.

Varieties were rated for indicated diseases (except stem canker) at the locations indicated in the below tables. Ratings were based on a scale of 0 to 9: for frogeye leaf spot (FLS), 0 = no disease present and 9 = severe disease symptoms; for Cercospora leaf blight (CLB), 0 = no disease, 5 = disease present on leaves, and 9 = purple pods, petioles and stems; for Septoria brown spot (SBS) and target spot (TS), 0 = no disease, 1 = disease present on lowest leaves, 5 = disease present in middle of the canopy, and 9 = disease present in the upper canopy with severe defoliation. Green stem (GS), where present, was rated on a 0-100% scale and indicates percentage of green stem malady on a whole plot basis.

Ratings are based on each variety's reaction to natural infestations of each disease (except stem canker) at each location; i.e., plants were not inoculated with disease pathogens. Thus, the ratings do not presume to indicate a variety's response to a known yield-reducing level of the pathogen. Rather, the ratings are to be used as an indicator of each variety's reaction to the level of the pathogen present at each location in 2015. Stem canker ratings were made where plants had been inoculated with the pathogen.

At the Longwood location near Leland, MS, an accidental application of Quadris Top at 8 fl. oz./acre resulted in varying levels of injury (phytotoxicity) among the cultivars. Ratings of phytotoxicity occurring on the MG IV early and late entries were made using a 0-9 scale, where 0 = no observable injury symptoms, 1 = mild injury symptoms, 5 = moderate injury symptoms, and 9 = severe injury symptoms.

Statistics

LSD (least significant difference). These values are used as a statistical tool to determine significant differences among variety ratings. The average ratings of any two varieties being compared must differ by more than the LSD value to be considered different in a particular test.

Put another way, the LSD is the smallest difference between ratings of two varieties that can be attributed to an actual difference in the varieties' disease susceptibility in a particular trial. Thus, a difference in the ratings of two varieties that exceeds the LSD is attributable to a difference in the disease susceptibility of the two varieties. Even though the average ratings of two varieties may be numerically different, the two disease ratings are not considered significantly different if that difference does not exceed the test LSD.

Probability level (*p* value). A disease rating difference between two varieties that exceeds the LSD value will be expected to do so 9 times out of 10 at the 10% (.10) level of probability, 19 times out of 20 at the 5% (.05) level, 99 times out of 100 at the 1% (.01) level, etc. The smaller the probability level, the more stringent the statistical test.

CV (coefficient of variation) and/or R² (coefficient of determination). These values are a measure of the relative precision of a given trial and can be used to compare the relative precision of different trials. The CV is generally considered to be an estimate of the amount of unexplained variation in a given trial or test, while the R² is a measure of the amount of variation that is explained or accounted for in a given test. A CV below 10% (10% unexplained variation in a trial) is desired, while an R² above 0.90 (90% of the variation in a trial has been accounted for) is desired.

MISSISSIPPI SOYBEAN PROMOTION BOARD

Data are presented in tables in the following order.

- Table 1 Reaction of MG III soybean cultivars to indicated diseases, NMREC, Verona, MS, 2015.
- Tables 2-5 Reaction of MG IV soybean cultivars to indicated diseases, NMREC, Verona, MS, 2015.
- Tables 6-8 Reaction of MG V soybean cultivars to indicated diseases, NMREC, Verona, MS, 2015.
- Tables 9-12 Reaction of MG IV soybean cultivars to stem canker, Stoneville, MS, 2015.
- Tables 13-16 Reaction of MG V soybean cultivars to stem canker, Stoneville, MS, 2015.
- Table 17 Reaction of MG IV conventional soybean varieties to indicated diseases at indicated Mississippi locations, 2015.
- Tables 18-23 Reaction of MG IV Early soybean cultivars to indicated diseases at indicated Mississippi locations, 2015
- Tables 24-29 Reaction of MG IV Late soybean cultivars to indicated diseases at indicated Mississippi locations, 2015
- Tables 30-34 Reaction of MG IV LibertyLink soybean cultivars to indicated diseases at indicated Mississippi locations, 2015
- Table 35 Reaction of MG V conventional soybean cultivars to indicated diseases at indicated Mississippi locations, 2015.
- Tables 36-40 Reaction of MG V Early soybean cultivars to indicated diseases at indicated Mississippi locations, 2015
- Tables 41-45 Reaction of MG V Late soybean cultivars to indicated diseases at indicated Mississippi locations, 2015
- Tables 46-50 Reaction of MG V LibertyLink soybean cultivars to indicated diseases at indicated Mississippi locations, 2015

Ratings for Septoria (Septoria brown spot) and target spot were based on a scale where 0 = no disease, 5 = disease in the middle of the canopy and 9 = disease in the upper canopy with severe defoliation.

2015 SOYBEAN VARIETY TRIAL STEM CANKER RATINGS

All entries in the 2015 Mississippi State University Official Variety Trials (OVT) were evaluated for their reaction to the stem canker fungus. Trials consisted of single rows of each variety planted in 10-foot-long plots that were replicated four times. Within each row, 8 plants were each inoculated with a single toothpick that contained the fungus that causes stem canker. Plants were inoculated approximately 8 weeks after planting. Evaluations of stem canker reaction of each variety were conducted between R6 and R6.5 by assessing the presence and severity of a canker on the stem of each inoculated plant.

Ratings of each variety for stem canker were conducted using a modified 0-9 scale. Data in each stem canker ratings table are the average rating of the inoculated plants of each variety in a single plot averaged across the four replicates. Also included is a designation of each variety's reaction to stem canker, where R=resistant, MR=moderately resistant, MS=moderately susceptible, and S=susceptible. Keep in mind that soybean varieties' reaction to stem canker tend to be more obvious when the environment is conducive for disease development. Therefore, over time and because years will be different in their conduciveness to development of stem canker, it is possible that stem canker designations for a given variety can change across years.

Table 9. Reaction of Maturity Group IV conventional soybean cultivars to stem canker, 2015.

¹Stem canker reaction: 8 plants per plot were inoculated with infested toothpicks. Ratings are individual plant reaction using a modified 0-9 scale based on lesion severity and are presented as the average of the eight plants across four replicates. Where a lesion did not appear, a rating of 0 (resistant) was assigned. Ratings were assigned based on the presence of a lesion where a reaction that produced a visible lesion that did not expand up the length of the stem was assigned a 1. Dead plants with lesions that extended up most of the plant's stem received a score of 9.

²Means followed by the same letter(s) within a column are not significantly different according to Fisher's Protected LSD ($P=0.05$).

³By using the Mean Disease Rating, a standardized designation is as follows: 1 = Resistant; 3 = Moderately Resistant; 5 = Moderately Susceptible; and 7 = Susceptible.

¹Stem canker reaction: 8 plants per plot were inoculated with infested toothpicks. Ratings are individual plant reaction using a modified 0-9 scale based on lesion severity and are presented as the average of the eight plants across four replicates. Where a lesion did not appear, a rating of 0 (resistant) was assigned. Ratings were assigned based on the presence of a lesion where a reaction that produced a visible lesion that did not expand up the length of the stem was assigned a 1. Dead plants with lesions that extended up most of the plant's stem received a score of 9.

²Means followed by the same letter(s) within a column are not significantly different according to Fisher's Protected LSD (*P*=0.05).

³By using the Mean Disease Rating, a standardized designation is as follows: 1 = Resistant; 3 = Moderately Resistant; 5 = Moderately Susceptible; and 7 = Susceptible.
